

SPDR Bloomberg Barclays Emerging Markets Local Bond UCITS ETF

Highlights
Fixed Income

Q1 2021

A Morningstar Bronze rated,¹ physical UCITS ETF tracking the Bloomberg Barclays Emerging Markets Local Currency Liquid Government Bond Index, from a provider with a track record of managing this index exposure.

Reasons to Consider this Exposure

- Real yield differential to global developed market government bonds remains attractive at over 3%.²
- Due to country inclusion criteria, the Bloomberg Barclays Emerging Markets Local Currency Liquid Government Bond Index has, over time, exhibited a better risk-adjusted profile compared to some of its peers.³
- US dollar evolution could drive performance in the short run. Despite declines in the US dollar, the pandemic has left, EM currencies looking relatively more attractive. State Street's currency valuation model, based on Purchasing Power Parity, calculates that the basket of EM currencies in our ETF was 3.4% undervalued versus the US dollar at the end of 31 January 2021 (see chart on next page).
- This ETF is also available in a EUR-hedged share class for investors looking to hedge currency exposure to mitigate some of the fairly volatile currency risk associated with the asset class. See page 4 for further details.

How Can Investors Incorporate the Fund into their Portfolios?

- The ETF can provide straight forward access to an asset class that might be too onerous to access directly via traditional means.
- It can be used as a strategic portfolio building block, providing exposure to EM local currency debt.
- The ETF can help with cash and liquidity management. An allocation to the ETF may allow a cash allocation to be kept to a minimum, in turn managing out-of-market exposure and cash drag.

Understanding the Index

The Bloomberg Barclays Emerging Markets Local Currency Liquid Government Bond Index is a country-constrained, more liquid version of the flagship Emerging Markets Local Currency Government Index, which is designed to provide a broad measure of the performance of local currency EM debt.

The Index follows the same index construction rules as the flagship index but applies higher local currency amount outstanding minimum issue sizes. It also limits country exposure to a maximum of 10%, with excess market value redistributed index-wide on a pro rata basis.

Introducing the EUR-Hedged Share Class

When investing in emerging market debt, many EUR investors prefer to hedge the currency exposure to mitigate some of the fairly volatile currency risk associated with the asset class.

Unfortunately, hedging emerging market currencies tends to be very expensive, which can wipe out a large portion of the extra yield that makes this exposure attractive to investors.

SPDR, in partnership with Bloomberg, has introduced a currency-hedging methodology new to the ETF market, hedging only the USD base currency return of the index to EUR.

This approach ensures investors are protected from a strengthening EUR, while also not having as drastic an impact on the real yield differential of the underlying exposure.

How is the Hedging Implemented?

A standard unhedged methodology assumes that an investor buys a bond denominated in a foreign currency at the beginning of the month, sells the bond at the end of the month, and converts the foreign currency proceeds back into the base currency.

Therefore, an unhedged investor's total return can be expressed by:

$$\text{Share Class Currency Unhedged Total Return} = (1 + \text{Base Currency Total Return}) * (1 + \text{FX Appreciation}_{\text{Base Currency/Share Class Currency}}) - 1$$

Where:

$$\text{FX Appreciation} = \frac{FX_{end} - FX_{beg}}{FX_{beg}}$$

Whereas a base currency, fully hedged index assumes an investor buys a bond denominated in a foreign currency at the beginning of the month, sells the bond at the end of the month, and converts the foreign currency proceeds back into the base currency, while also entering into an FX forward position going short the bond's local currency and long the base currency.

The Share Class Hedged Total Return index instead assumes an investor buys the index in the base currency and sells an equal amount of FX forwards in the share class currency at the beginning of the month, then sells the index and closes the FX forward at the end of the month, converting the base currency proceeds back into the share class currency and realising the P&L from the FX forward.

The investor's (share class currency) realised (hedged) total return on investment can therefore be expressed as:

$$\text{Share Class Currency Hedged Total Return} = \text{Local Return} + \text{Share Class Currency Unhedged Total Return} + \text{Forward Return}$$

Where:

$$\text{Forward Return} = \frac{\text{Forward Value} - \text{FX}_{\text{Base Currency/Share Class Currency}}}{\text{FX}_{\text{Base Currency/Share Class Currency}}}$$

The Share Class Hedged Total Return index differs from the Base Currency Hedged Total Return index as it makes no assumption of an expected local currency bond return.

As the share class of the fund is purchasing the base currency fund, not the underlying security, any expected local currency bond return should be accounted for in the base currency return of the fund.

The forward value is the 1-month forward of the base currency/share class currency.

Intra-month, this forward rate is prorated to unwind an FX forward contract where day (i) is an interpolation between the Spot (S_B) and 1-month forward rates ($F_{B,1M}$) at the beginning of the month. A 30-day contract is assumed regardless of actual days.

$$F_t = S_B + (F_{B,1M} - S_B) * \frac{\text{Number of Calendar Days Passed}}{30}$$

FX rates used are WM 1600 London.

Potential Risks

Duration/Interest Rate Risk Changes in interest rates are likely to affect the value of bonds and other debt instruments.

Emerging Markets Risk Risks of investing in emerging markets include, among others, greater political and economic instability, possible trade barriers, volatility in currency exchange rates, currency transfer restrictions or difficulties in gaining currency exposure, less developed securities markets, legal systems and financial services industries, differences in auditing and financial reporting standards, and greater dependence on revenue from particular commodities or international aid.

Lower-Rated Securities Risk Lower-quality debt securities ("high yield" or "junk" bonds) can involve a substantially greater risk of default than higher quality debt securities.

Investing involves risk including the risk of loss of principal.

Investments in emerging or developing markets may be more volatile and less liquid than investing in developed markets and may involve exposure to economic structures that are generally less diverse and mature and to political systems

which have less stability than those of more developed countries.

Investing in foreign domiciled securities may involve risk of capital loss from unfavourable fluctuation in currency values, withholding taxes, from differences in generally accepted accounting principles or from economic or political instability in other nations. Bonds generally present less short-term risk and volatility than stocks, but contain interest rate risk (as interest rates raise, bond prices usually fall); issuer default risk; issuer credit risk; liquidity risk; and inflation risk. These effects are usually pronounced for longer-term securities. Any fixed income security sold or redeemed prior to maturity may be subject to a substantial gain or loss.

Government bonds generally have more moderate short-term price fluctuations than stocks, but provide lower potential long-term returns.
